

Week 10

A PlayStation Games Console

A PlayStation is a type of “games console” on Earth, one where humans use to entertain themselves with digital activity that appears on a screen. It requires a disc, a television (or TV for short) and a power source to use. The console and television is plugged into the power source for electricity to power the objects with energy to work. Without it, it does not work. The console is also plugged into the television where information is output into images onto the screen of the television.

You need to insert a disc into the PlayStation for more option of human entertainment. The most common is a “game” which you can use a controller to control the game with. You control anything that goes on screen with the controller. This controller is powered by the power of the console by having a wire that plugs into it, but it can also be wireless unless it runs out of power so you will have to plug it in again. There are other forms of disc also, such as movie discs (sometimes known as DVD or Blu-ray) where you are able to watch videos of events and stories, and there are musical discs that play various sounds and music for humans to enjoy.
